

**NEW COVID – 19 Booster-** If you are on treatment for an autoimmune disease, with the exception of Rituxan, which has special recommendations to discuss with your physician, we recommend that you get the NEW COVID-19 Booster shot. The booster should be administered NO SOONER than 6 Months after your second original COVID-19 shot. If you are on Methotrexate, take the COVID-19 Booster 1 week after last dose of Methotrexate and then resume Methotrexate 1 week after receiving the Booster shot.

**FLU Vaccine** - The CDC recommends everyone 6 months or older get a flu vaccine each year, as long as they do not have certain symptoms or conditions.

Those who should consult a medical professional about flu vaccines may be immunocompromised, have a history of severe allergic reaction to any component of the vaccine, children between 2-4 who have received a diagnosis of asthma or people who are pregnant.

**RSV (respiratory syncytial virus) Vaccine** – The respiratory syncytial virus is a "common respiratory virus that usually causes mild, cold-like symptoms," according to the [CDC](#). Infants and adults 60 and older are most at risk for severe outcomes from RSV and should receive the vaccine.

If you have any questions, such as how to hold other medication for the vaccine, please direct them through the portal.
